Shreya Narayani

LinkedIn • Github • Personal Portfolio

PROFESSIONAL SUMMARY

Data Analyst with hands-on experience in Python, Tableau, and Excel, focused on transforming raw datasets into actionable business insights. Skilled in data cleaning, exploratory data analysis, and building interactive dashboards to uncover trends and support data-driven decision making.

EDUCATION

Bachelor of Technology (Data Science) 2024 – 2028
Newton School of Technology, Rishihood University Grade: 8.5/10.0

Intermediate (Class XII) 2022 – 2023
Mahima Vikas Higher Secondary Grade: 82%

Secondary School (Class X) 2019 – 2020
Sarala Birla Public School Grade: 83%

PROJECTS

DataCron — Automotive Data Quality & Analytics Dashboard (Github)

Tools: React, Python, Recharts, Vite, Vercel

- Built an interactive web-based dashboard to perform multi-domain data quality audits on automotive datasets (~2,250 records), enabling real-time visual inspection of data health across multiple attributes.
- Designed and implemented a Python-based data cleaning pipeline to detect and resolve missing values, inconsistencies, and schema validation issues, improving dataset reliability to near 100%.
- Identified and resolved 1,600+ data quality issues, including duplicate entries, invalid formats, and outlier values, ensuring completeness and structural integrity of the dataset.
- Developed dynamic, interactive visualizations using Recharts to display completeness scores, consistency metrics, and attribute-level data quality analysis across brand categories.
- Engineered a modular audit framework covering key data quality dimensions — completeness, validity, and uniqueness — with support for brand-level filtering and natural language-based query handling.
- Deployed the application on Vercel with a fully responsive UI, optimized frontend performance, and seamless integration between the Python audit backend and React dashboard.

Healthcare Patient Readmission Intelligence (Github)

Tools: Python, Pandas, Scikit-learn, Tableau, Jupyter Notebook

- Developed a machine learning pipeline to predict hospital patient readmission risk, enabling healthcare providers to identify high-risk patients and allocate resources more effectively.
- Performed comprehensive end-to-end data preprocessing on patient records including missing value imputation, categorical encoding, outlier treatment, and feature engineering for clinical attributes.
- Conducted exploratory data analysis (EDA) to surface key readmission drivers such as diagnosis type, length of stay, discharge disposition, and number of prior admissions.
- Trained and evaluated multiple classification models including Logistic Regression, Random Forest, and Gradient Boosting, optimizing performance using cross-validation and hyperparameter tuning.
- Built interactive Tableau dashboards to visualize patient readmission trends, demographic distributions, and model-driven risk scores, making insights accessible to clinical and non-technical stakeholders.
- Structured the project following a professional data science workflow — data ingestion, preprocessing, feature selection, modeling, and reporting — ensuring reproducibility and clarity.
- Generated actionable insights and risk-stratified patient segments to support hospital administration in designing targeted intervention strategies and reducing preventable readmissions.

SKILLS

Languages: Python, SQL
Libraries: Pandas, NumPy, Matplotlib, Seaborn, Scikit-learn
Analytics: Data Cleaning, EDA, Data Visualization, KPI Analysis, Dashboard Design
Tools & Platforms: Excel, Power Query, Tableau, Jupyter Notebook
